

STATE REPORT 10.18.2020

ILLINOIS

SUMMARY

- As we continue to work with each of you on data quality and data reporting, we will continue to add relevant data to our joint understanding. We greatly appreciate the feedback and we use this to continually improve. This week, we have included the data reported to HHS from your hospitals regarding admissions and next, we will include PPE data reported.
- Illinois continues to have high and worsening transmission affecting the entire state. Illinois is in the red zone for cases, indicating 101 or more new cases per 100,000 population last week, with the 18th highest rate in the country. Illinois is in the yellow zone for test positivity, indicating a rate between 5.0% and 7.9%, with the 26th highest rate in the country.
- Illinois has seen a sharp increase in new cases and a steep increase in test positivity over the last week. Hospitalizations have continued to increase sharply.
- Moderate to high viral transmission is widely distributed throughout Illinois. The following three counties had the highest number of new cases over the last 3 weeks: 1. Cook County, 2. DuPage County, and 3. Winnebago County. These counties represent 46.4% of new cases in Illinois.
- Although the largest number of cases are reported by counties in the Chicago CBSA, only 4 of 102 counties in the state had fewer than 100 cases per 100,000 population last week. 83% of all counties in Illinois have moderate or high levels of community transmission (yellow, orange, or red zones), with 28% having high levels of community transmission (red zone). The number of counties on the state warning list as of Oct 16 increased to 34 from 26 the previous week.
- Outbreaks have been tied to social gatherings (weddings, funerals, college parties) with large numbers of young people and without social distancing; news reports indicate that some businesses are not following mitigation measures.
- Institutions of higher education (IHE): University of Illinois at Urbana-Champaign (Champaign) continues to report decreasing rates among the campus community with decreasing cases and test positivity (0.16%) in the last week despite the increasing rate of cases in the state and the slight overall increase in Champaign County.
- During the week of Oct 5 - Oct 11, 13% of nursing homes had at least one new resident COVID-19 case, 26% had at least one new staff COVID-19 case, and 3% had at least one new resident COVID-19 death.
- Illinois had 179 new cases per 100,000 population in the last week, compared to a national average of 117 per 100,000.
- Current staff deployed from the federal government as assets to support the state response are: 62 to support operations activities from FEMA; 5 to support operations activities from ASPR; and 7 to support operations activities from USCG.
- Between Oct 10 - Oct 16, on average, 216 patients with confirmed COVID-19 and 542 patients with suspected COVID-19 were reported as newly admitted each day to hospitals in Illinois. An average of 95% of hospitals reported either new confirmed or new suspected COVID patients each day during this period.

RECOMMENDATIONS

- We have included cases, test positivity, and deaths by month in the back of your packet to show the time sequence in Illinois and the country as a whole. These demonstrate the impact of comprehensive mitigation efforts when implemented effectively and that partial or incomplete mitigation leads to prolonged community spread and increased fatalities.
- Illinois has a carefully crafted plan for tiered mitigation for the 11 public health regions in the state. Continue the strong mitigation efforts statewide. Mitigation efforts should continue to include mask wearing, physical distancing, hand hygiene, avoiding crowds in public and social gatherings in private, and ensuring flu immunizations, as well as tailored business and public venue measures.
- Continue to use testing and case investigations strategically to identify and mitigate these high incidence jurisdictions and transmission venues. Use of rapid tests can be extremely helpful in doing this.
- As state and local leaders use case investigation information to weigh how to most effectively mitigate increasing cases while maximizing economic activity, it may be useful to emphasize that compliance with restrictions on public and private gathering sizes, especially indoors, will help limit the super-spreader events that are critical to rapid epidemic spread. This in turn will help to increase the level at which businesses can operate safely. State and local leaders should work intensely with business leaders and communities to ensure a clear and shared message and continue to ask Illinoisans to continue mitigation measures.
- In red and orange counties, both public and private gatherings should be as small as possible and optimally, not beyond immediate family. Encourage outdoor activities and ensure mask and physical distancing messages for all residents.
- Ensure university students continue their mitigation behaviors to ensure no further outbreaks on or off campus as symptomatic cases and cases identified through surveillance testing on campus decline.
- Concern remains for further increases in community transmission with increasing hospitalizations and deaths, given the continued spread among younger age groups, much of which is asymptomatic, as has been seen in "hotspot" counties generally ([MMWR Early Release/October 9, 2020](#)).
- Community transmission is frequently occurring in smaller gatherings of family and friends, especially among young adults, where masking and social distancing recommendations are not followed. With weather conditions increasingly forcing activities indoors, recommend increased messaging regarding the need to take these measures, especially given the element of "prevention fatigue."
- Continue testing programs in long-term care facilities, with prompt testing of all residents in any facility with an active case and repeat testing for all staff. Utilize point-of-care testing platforms to facilitate rapid COVID-19 case identification.
- Continue to implement plans to increase surveillance for community spread using the Abbott BinaxNOW or other antigen tests, especially to protect the elderly and other vulnerable populations. Establish weekly surveillance to monitor degree of community spread among K-12 teachers; staff working at nursing homes, assisted living, and other congregate living settings; prison staff; and first responders as tests become available. Increased rates of infection seen among long-term care facility workers indicate significant transmission in their communities and those transmission settings must be identified and mitigated.
- Specific, detailed guidance on community mitigation measures can be found on the [CDC website](#).

The purpose of this report is to develop a shared understanding of the current status of the pandemic at the national, regional, state and local levels. We recognize that data at the state level may differ from that available at the federal level. Our objective is to use consistent data sources and methods that allow for comparisons to be made across localities. We appreciate your continued support in identifying data discrepancies and improving data completeness and sharing across systems. We look forward to your feedback.

**COVID-19**

ILLINOIS

STATE REPORT | 10.18.2020

	STATE, LAST WEEK	STATE, % CHANGE FROM PREVIOUS WEEK	FEMA/HHS REGION, LAST WEEK	UNITED STATES, LAST WEEK
NEW COVID-19 CASES (RATE PER 100,000)	22,661 (179)	+42%	90,824 (173)	383,209 (117)
VIRAL (RT-PCR) LAB TEST POSITIVITY RATE	6.2%	+1.6%*	6.8%	5.4%
TOTAL VIRAL (RT-PCR) LAB TESTS (TESTS PER 100,000)	372,782** (2,942)	+4%**	1,531,764** (2,915)	7,141,821** (2,176)
COVID-19 DEATHS (RATE PER 100,000)	221 (1.7)	+10%	742 (1.4)	4,931 (1.5)
SNFs WITH ≥1 NEW RESIDENT COVID-19 CASE (≥1 NEW STAFF CASE)	13% (26%)	+3%* (+4%*)	11% (25%)	10% (22%)
SNFs WITH ≥1 NEW RESIDENT COVID-19 DEATH	3%	-1%*	3%	4%

HOSPITAL
ADMISSIONS

* Indicates absolute change in percentage points.

** Due to delayed reporting, this figure may underestimate total diagnostic tests and week-on-week changes in diagnostic tests.

DATA SOURCES – Additional data details available under METHODS

Note: Some dates may have incomplete data due to delays in reporting. Data may be backfilled over time, resulting in week-to-week changes.**Cases and Deaths:** State values are calculated by aggregating county-level data from USAFacts; therefore, the values may not match those reported directly by the state. Data is through 10/16/2020; last week is 10/10 - 10/16, previous week is 10/3 - 10/9.**Testing:** CELR (COVID-19 Electronic Lab Reporting) state health department-reported data through 10/14/2020. Last week is 10/8 - 10/14, previous week is 10/1 - 10/7.**SNFs:** Skilled nursing facilities. National Healthcare Safety Network. Data are reported separately for cases among residents and staff. Last week is 10/5-10/11, previous week is 9/28-10/4. Facilities that are undergoing reporting quality review are not included in the table, but may be included in other NHSN analyses.**Hospitalizations:** Unified hospitalization dataset in HHS Protect. These data exclude psychiatric, rehabilitation, and religious non-medical hospitals. In addition, hospitals explicitly identified by states/regions as those from which we should not expect reports were excluded from the percent reporting figure.

Deaths: County-level data from USAFacts through 10/16/2020. Last week is 10/10 - 10/16; the week one month before is 9/12 - 9/18; the week two months before is 8/15 - 8/21; the week three months before is 7/18 - 7/24.

METHODS

STATE REPORT | 10.18.2020

COLOR THRESHOLDS: Results for each indicator should be taken in context of the findings for related indicators (e.g., changes in case incidence and testing volume). Values are rounded before color classification.

Metric	Dark Green	Light Green	Yellow	Orange	Red
New cases per 100,000 population per week	≤4	5 – 9	10 – 50	51 – 100	≥101
Percent change in new cases per 100,000 population	≤-26%	-25% – -11%	-10% – 0%	1% – 10%	≥11%
Diagnostic test result positivity rate	≤2.9%	3.0% – 4.9%	5.0% – 7.9%	8.0% – 10.0%	≥10.1%
Change in test positivity	≤-2.1%	-2.0% – -0.6%	-0.5% – 0.0%	0.1% – 0.5%	≥0.6%
Total diagnostic tests resulted per 100,000 population per week	≥2001	1001 – 2000	750 – 1000	500 – 749	≤499
Percent change in tests per 100,000 population	≥26%	11% – 25%	1% – 10%	-10% – 0%	≤-11%
COVID-19 deaths per 100,000 population per week	≤0.1	0.2 – 0.4	0.5 – 1.0	1.1 – 2.0	≥2.1
Percent change in deaths per 100,000 population	≤-26%	-25% – -11%	-10% – 0%	1% – 10%	≥11%
Skilled Nursing Facilities with at least one resident COVID-19 case, death	0%		1% – 5%		≥6%
Change in SNFs with at least one resident COVID-19 case, death	≤-2%		-1% – 1%		≥2%

DATA NOTES

- Some dates may have incomplete data due to delays in reporting. Data may be backfilled over time, resulting in week-to-week changes. It is critical that states provide as up-to-date data as possible.
- Cases and deaths:** County-level data from USAFacts as of 16:33 EDT on 10/18/2020. State values are calculated by aggregating county-level data from USAFacts; therefore, values may not match those reported directly by the state. Data are reviewed on a daily basis against internal and verified external sources and, if needed, adjusted. Last week data are from 10/10 to 10/16; previous week data are from 10/3 to 10/9; the week one month before data are from 9/12 to 9/18.
- Testing:** The data presented represent viral COVID-19 laboratory diagnostic and screening test (reverse transcription polymerase chain reaction, RT-PCR) results—not individual people—and exclude antibody and antigen tests, unless stated otherwise. CELR (COVID-19 Electronic Lab Reporting) state health department-reported data are used to describe county-level viral COVID-19 laboratory test (RT-PCR) result totals when information is available on patients' county of residence or healthcare providers' practice location. HHS Protect laboratory data (provided directly to Federal Government from public health labs, hospital labs, and commercial labs) are used otherwise. Some states did not report on certain days, which may affect the total number of tests resulted and positivity rate values. Because the data are deidentified, total viral (RT-PCR) laboratory tests are the number of tests performed, not the number of individuals tested. Viral (RT-PCR) laboratory test positivity rate is the number of positive tests divided by the number of tests performed and resulted. Resulted tests are assigned to a timeframe based on this hierarchy of test-related dates: 1. test date; 2. result date; 3. specimen received date; 4. specimen collection date. Resulted tests are assigned to a county based on a hierarchy of test-related locations: 1. patient residency; 2. provider facility location; 3. ordering facility location; 4. performing organization location. States may calculate test positivity other using other methods. Last week data are from 10/8 to 10/14; previous week data are from 10/1 to 10/7; the week one month before data are from 9/10 to 9/16. HHS Protect data is recent as of 08:09 EDT on 10/18/2020. Testing data are inclusive of everything received and processed by the CELR system as of 19:00 EDT on 10/17/2020.
- Hospitalizations:** Unified hospitalization dataset in HHS Protect. This figure may differ from state data due to differences in hospital lists and reporting between federal and state systems. These data exclude psychiatric, rehabilitation, and religious non-medical hospitals. In addition, hospitals explicitly identified by states/regions as those from which we should not expect reports were excluded from the percent reporting figure. The data presented represents raw data provided; we are working diligently with state liaisons to improve reporting consistency. Data is recent as of 16:54 EDT on 10/18/2020.
- Skilled Nursing Facilities:** National Healthcare Safety Network (NHSN). Data report resident and staff cases independently. Quality checks are performed on data submitted to the NHSN. Data that fail these quality checks or appear inconsistent with surveillance protocols may be excluded from analyses. Data presented in this report are more recent than data publicly posted by CMS. Last week is 10/5-10/11, previous week is 9/28-10/4. Facilities that are undergoing reporting quality review are not included in the table, but may be included in other NHSN analyses.
- County and Metro Area Color Categorizations**
 - Red Zone:** Those core-based statistical areas (CBSAs) and counties that during the last week reported both new cases at or above 101 per 100,000 population, and a lab test positivity result at or above 10.1%.
 - Orange Zone:** Those CBSAs and counties that during the last week reported both new cases between 51–100 per 100,000 population, and a lab test positivity result between 8.0–10.0%, or one of those two conditions and one condition qualifying as being in the “Red Zone.”
 - Yellow Zone:** Those CBSAs and counties that during the last week reported both new cases between 10–50 per 100,000 population, and a lab test positivity result between 5.0–7.9%, or one of those two conditions and one condition qualifying as being in the “Orange Zone” or “Red Zone.”
